

All project done in JSP files and this is my Algorithm.

1. first of all I create a Index page for input a username and password if not register then redirect to register page.

2. in register page fill the some information like First name, Last name, email, gender, contact no , user name, password and then login complete.

3. after login complete for action in registration page after complete process send redirect to welcome page and showing the message Registration is successful.

4. after I create a login page in user id and password enter if correct then next in success page if wrong input it come back in index page and try again message.

5. create flight page where some information about flight like Flight number, Flight name, Source, Destination, Class, Date of journey, Number of seat available after completing flight detail hole action perform in booking page.

6. create a book page where Flight no, Flight name, Source, Destination, Class, Date of journey, num of seat available, passenger name, Age, Gender, Seat preference, and Aadhar no optional enter the hole information all action in book confirm page.

7. create page book confirm and put hole information process to complete send redirect me to booked page.

8. i create a booked page For transaction go to : `` reference for success page and take me back home page for booking another ticket.

9. create a history page where saved my previous booking history and operate my next process.

10. create a page cancel where I cancel my booking ticket option perform like flight no, seat, date of journey etc and when I press cancel it take me to next page cancelled.

11. i create a cancelled page where I cancel my previous booking if my booking cancel then show me a message Ticket cancelled successfully.

12. when I cancel my another ticket reference go to history and select and follow the hole process.

13. i create a logout page if any wrong data put it take me to logout and reference to login page.
